

# Rename and Domain Join Ansible Play

This book will cover how I automated my domain join for the globomantics domain

- Preparing the VMs
- Creating the Ansible Play

# Preparing the VMs

## Deploy the VMs

For this little experiment. I am deploying from template from a Windows 10 VM. I have not figured out how to make the interface profile stay private with any persistence and it is annoying. Any way, so the steps are simple.

- Deploy from Template
- Log in and change the ethernet interface to private
- Run the enable-winrm.ps1 powershell script
- Shutdown and snapshot so I can revert to pre domain join

# Creating the Ansible Play
